

Dear Editors of *Insights into Imaging*,

We are pleased to submit our manuscript entitled "*Stability of Dynamic Radiomics Features in Cardiac MRI Under Noise*", which investigates the impact of random noise on radiomic features in time-resolved cardiac MRI. Our study addresses a critical challenge in radiomics research by systematically analyzing how noise influences feature robustness — an essential step toward ensuring reproducibility and clinical translation.

Our research team has extensive expertise in cardiac imaging and radiomics, Prof. Bettina Baessler, has authored numerous high-impact publications on quantitative imaging biomarkers and radiomics in cardiovascular and oncologic imaging. Dr. Markus Ankenbrand previously published in the field of artificial intelligence for cardiac MRI segmentation and interpretability.

The findings of our study have direct clinical relevance: they provide practical guidance for the standardization and validation of radiomic approaches in multi-center cardiac imaging studies, ultimately supporting more reliable imaging biomarkers for patient care.

Please note that this work is available as a preprint on *medRxiv* (<https://doi.org/10.1101/2025.04.18.25326051>) to promote early dissemination within the scientific community.

Thank you for considering our manuscript for publication in *Insights into Imaging*. We look forward to your feedback.

Sincerely,
Dr. Markus J. Ankenbrand
